

How Adjusta-Flex Works

1

The first thing we realized was that a hose donut does not have to have a fully connected perimeter to do the job of protecting the hose and fittings

3

The donut is able to flex up and down, in and out. In doing so, the inside is able to hold a true circle thru a range of different diameters. The flex and open areas make it work.

Easily opens for placement over or around hose or fittings

2

The 3 areas that are cut away, create the "Flex Points" that are the key to the design. We call these "Bridges." They allow the donut to move in every direction

4

By removing a section from one area of the donut, we are able to reduce and enlarge its diameter as needed. The "Flex Points" allow it to hold its true circle.
